## DETAILED ACTION

### *Allowable Subject Matter*

1. Claims 1-26 are allowed.
2. The following is an examiner's statement of reasons for allowance:

The prior art does not teach or would not have rendered obvious a system (Figs. 8, 5) for generating an optimum phase shifted sampling clock for sampling a synchronized video signal  $A(t)$  having a synchronization signal SYNC pulse, such as claimed in claims 1-26, the system: generates (220) a sampling clock having a first edge aligned with a trailing edge of the SYNC pulse wherein the sampling clock period comprises the SYNC pulse period divided by  $M$ ; Counts (230) the number of sampling clock cycles  $N$  from the trailing edge of the SYNC pulse until the  $A(t)$  value at the first edge of the sampling clock exceeds a minimum value; thereafter phase shifts the sampling clock and the SYNC pulse forward until the  $A(t)$  value at the first edge of the sampling clock first exceeds a minimum value on clock cycle  $N-1$  to thereby establish a worst case phase shift of the sampling clock; and thereafter samples (240) the  $A(t)$  at an offset from the worst case phase shift to thereby generate an optimum phase shifted sampling clock. The closest prior art, Zhang et al (US 6,452,592 B2) discloses a conventional system - for generating a sampling clock signal that samples analog video signals for digital display systems - that has a phase shifter, a divisor calculator, and a counter as shown in Fig. 2(a), fails to anticipate or render obvious the present invention as claimed.
